Agriculture and Economic Development: Increasingly Inseparable

“While agricultural commodity output prices at the farm level have been relatively strong in the last couple of years, the same is true for input costs. Growth in the demand for local food points to opportunities for market expansion in both fresh and processed food production. However, careful strategies to manage the relation between profit margin and sales volume, keep costs competitively low, and improve market share through product differentiation remain important for success. Looking ahead, agriculturally related businesses must set priorities to address long-term growth strategies and re-investment. Prioritization must be undertaken in light of trends that are augmenting traditional food supply chains and infrastructure to better address changing consumer demands, nutrition, and improved food access. For the success of both public and private investment activities, engagement with a wider mainstream economic development community will be required.” Todd Schmit, Cornell University
